# Catastrophe Risk Quantification: Economic Capital Based

---

Convesion A Asia Program

March 24<sup>th</sup>, 2026

## Faizal Tama

Analytics Specialist at PT Reasuransi MAIPARK Indonesia  
Graduated from Gadjah Mada University, Bachelor of Statistics  
Fellow member of the Society of Actuaries of Indonesia

## Danar Handoyo

Risk Manager at PT Reasuransi MAIPARK Indonesia  
Graduated from Gadjah Mada University, Bachelor of Mathematics  
Certified Risk Management Professional (CRMP)

# Catastrophe Modelling

---

# Catastrophe Modelling

## Catastrophe Exposure (Risk)

- A **catastrophic event** is an extreme, unexpected occurrence that causes widespread damage and usually happens suddenly, such that the impact of the loss may exceed the ability to cope with or absorb it.
- **Catastrophic events** rarely occur (low-frequency) but have catastrophic impacts (high severity).
- **Catastrophe exposure** is the total risk that an insurance or reinsurance company faces, which has the potential for loss due to catastrophic events.
- **Managing catastrophe risk** is the ongoing process of: (1) identifying the risk given the context of the organization or community, (2) quantifying the risk, (3) deciding what to do, given the level of risk and the risk appetite (i.e. how much risk an entity is willing to take) of the organization or community, and (4) monitoring the level of risk.

# Catastrophe Modelling

What is Catastrophe Modelling?

According United Kingdom Lloyd's Market Association (LMA, 2013)

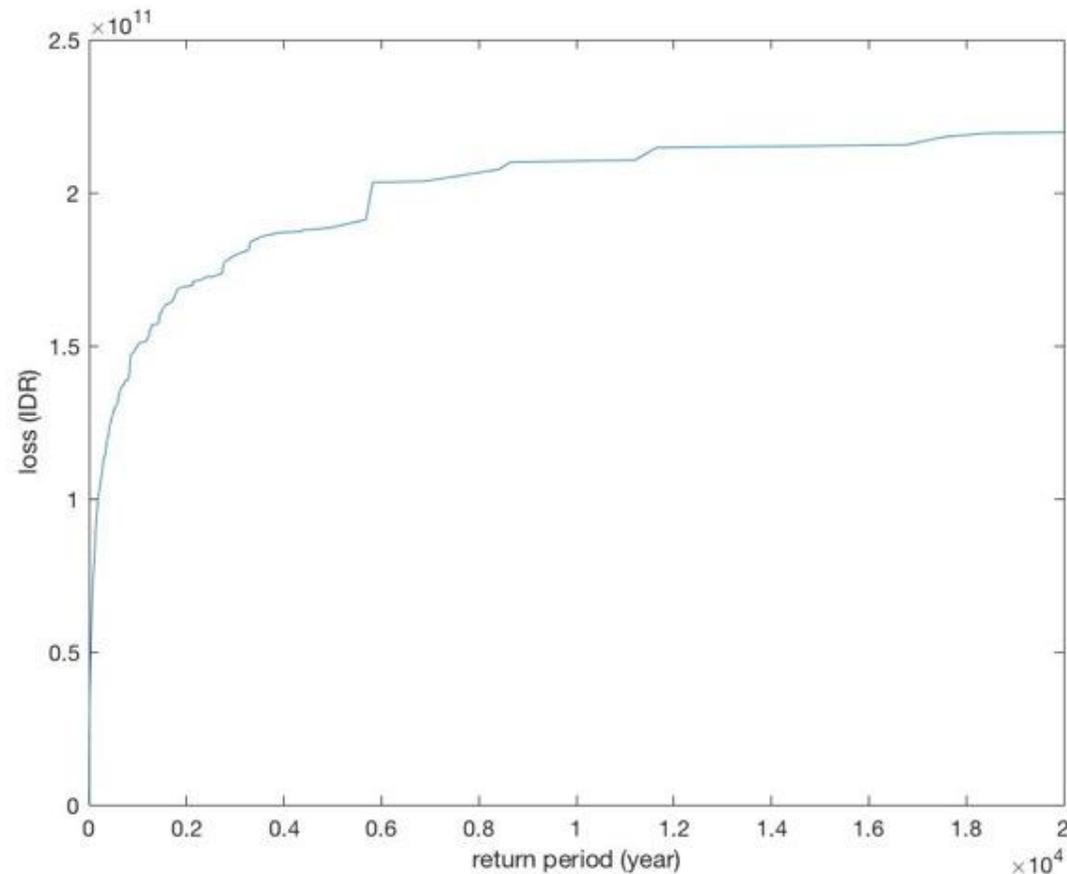

**Catastrophe Model** is a computerized system that generates a robust set of simulated events and estimates the magnitude, intensity, and location of the event to determine the amount of damage and calculate the insured loss as a result of a catastrophic event such as a hurricane or an earthquake.

# Catastrophe Modelling

Catastrophe Risk Measure – Average Annual Loss

Average annual loss : The expected annual loss from all earthquake occurrences is denoted as the average annual loss (average annual loss). Average annual loss also referred to as the pure premium or burning cost

$$AAL = \sum_i p_i L_i$$

$$\sigma = \sqrt{\sum_i (p_i L_i^2) - AAL^2}$$

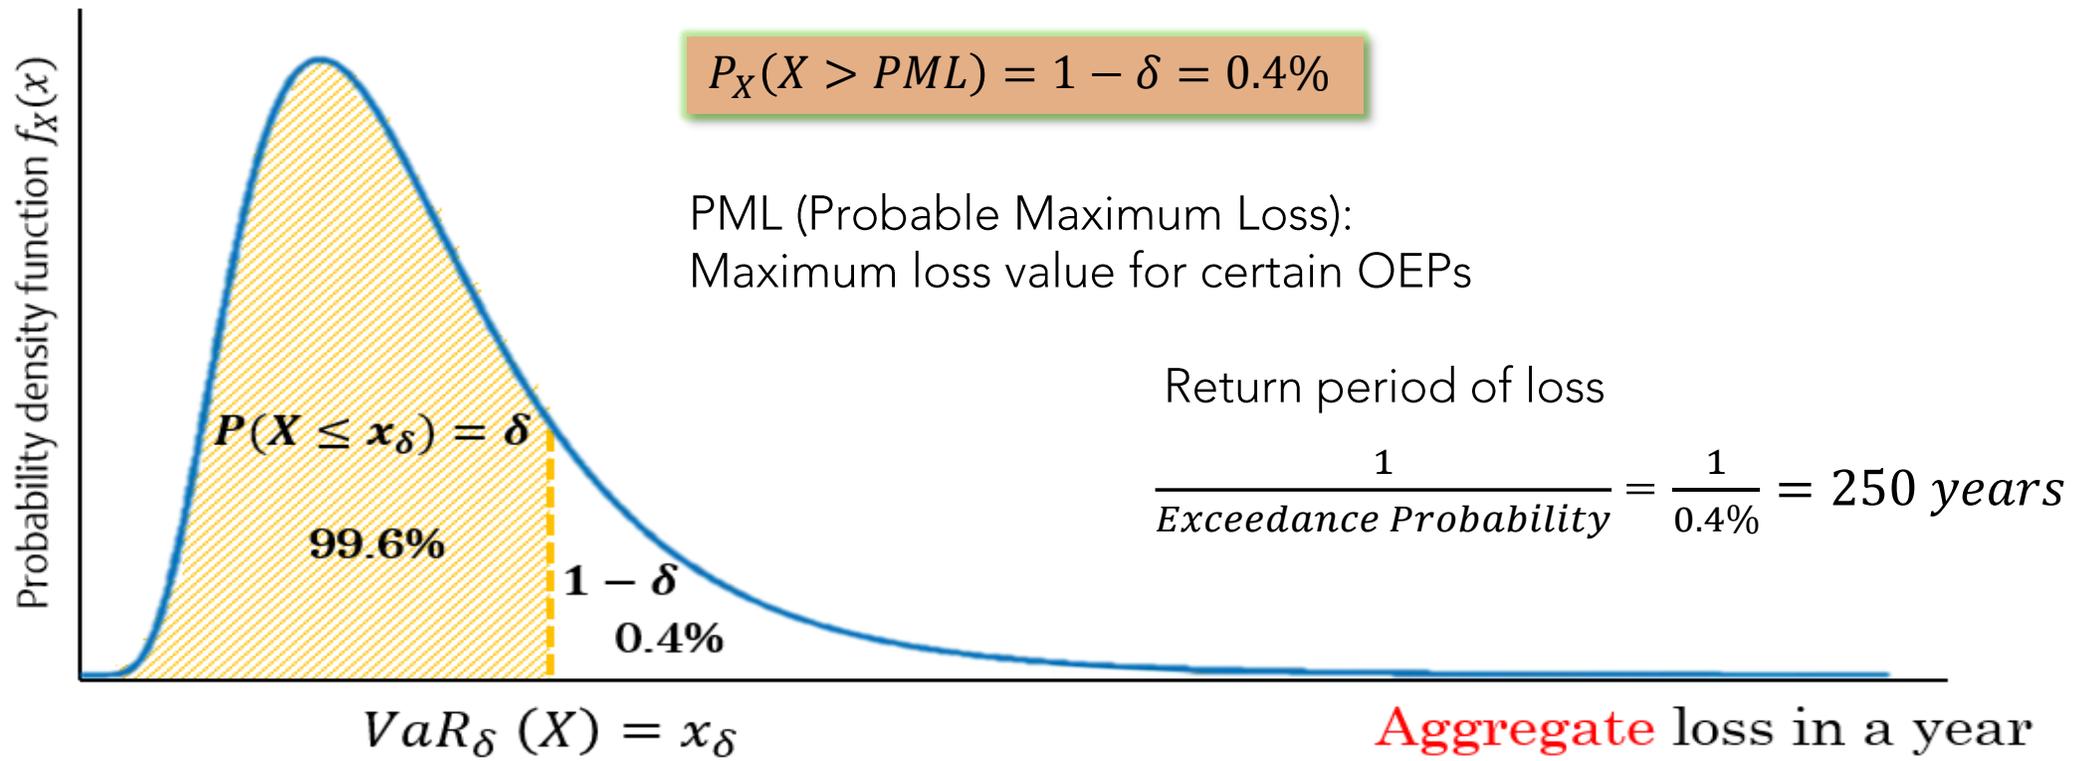

An excess probability curve gives the probabilities of various loss levels over a specified time. It relates the level of loss exceedance to the probability of an event occurring over the observed period. Assuming a Poisson distribution, the probability of exceeding a loss within a certain timeframe.

- **Occurrence Exceedance Probability (OEP)** *is the annual probability that the losses for at least one occurrence will exceed at certain amount.*
- **Aggregate Exceedance Probability (AEP)** *is the probability that aggregate losses in a year.*

# Catastrophe Modelling

Catastrophe Risk Measure – Occurrence Exceedance Probability (OEP)

Occurrence Exceedance Probability (OEP) curve  $F(x)$  describes the distribution of the largest event in a year,  $F(x)$  is the probability that the largest event in a year exceeds  $x$

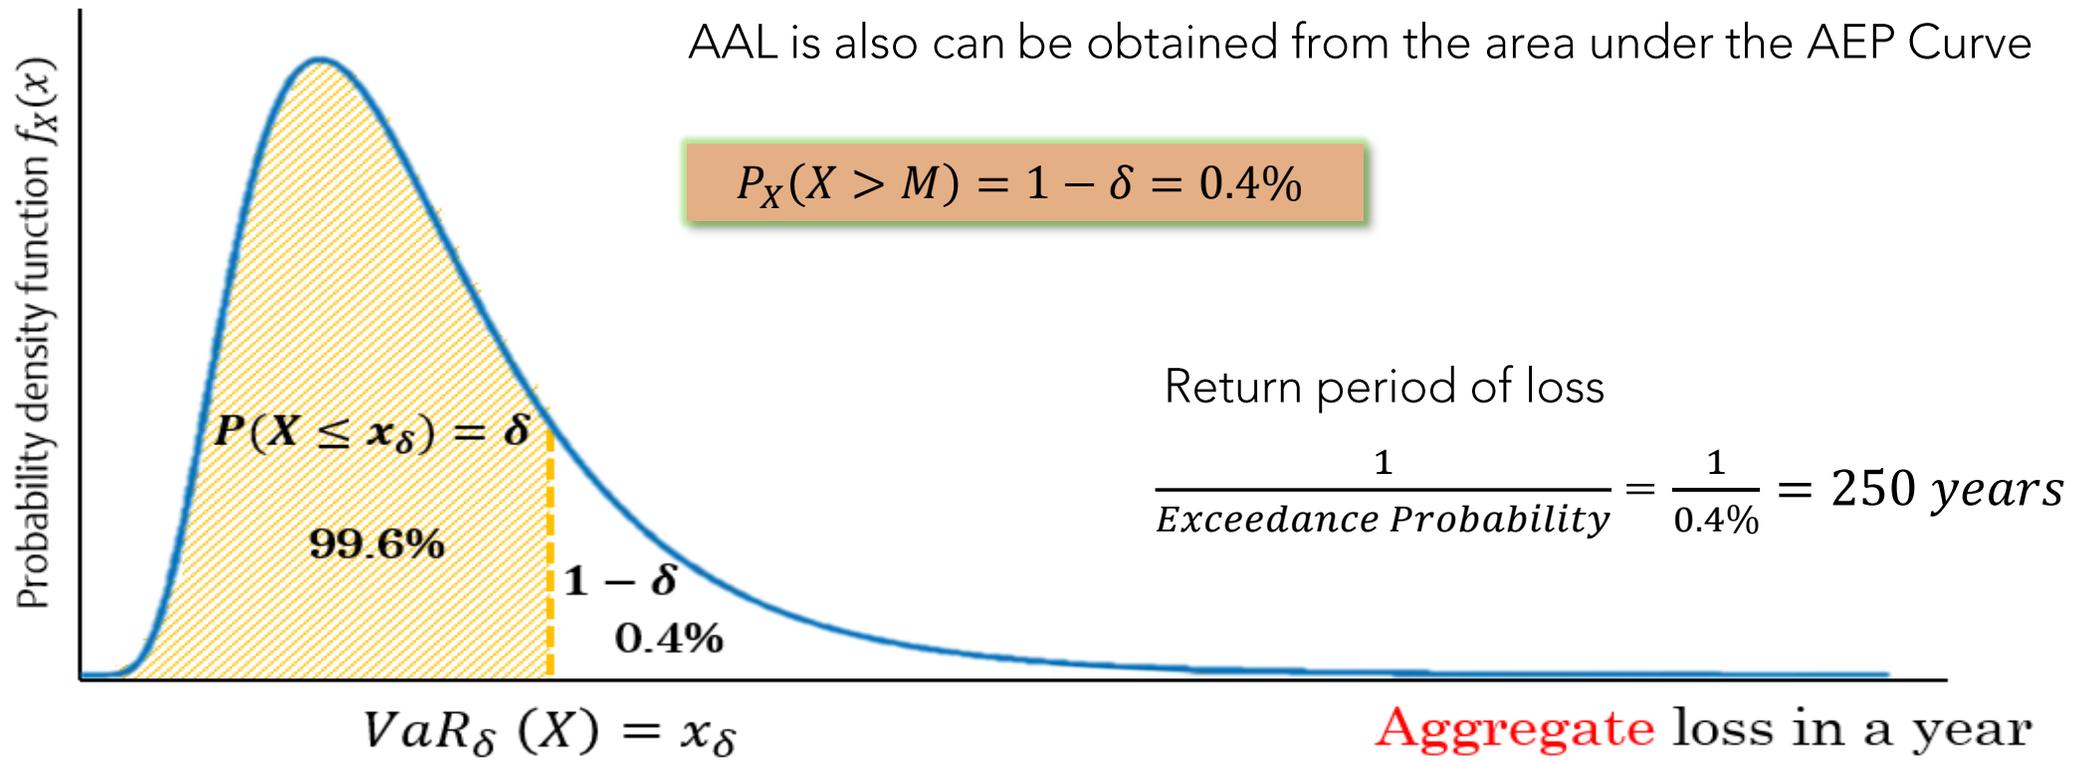

# Catastrophe Modelling

Catastrophe Risk Measure – Aggregate Exceedance Probability (AEP)

Aggregate Exceedance Probability (AEP) curve  $F(x)$  describes the sum of the events in a year. In particular,  $F(x)$  is the probability that the sum of the events in a year exceeds  $x$

AAL is also can be obtained from the area under the AEP Curve

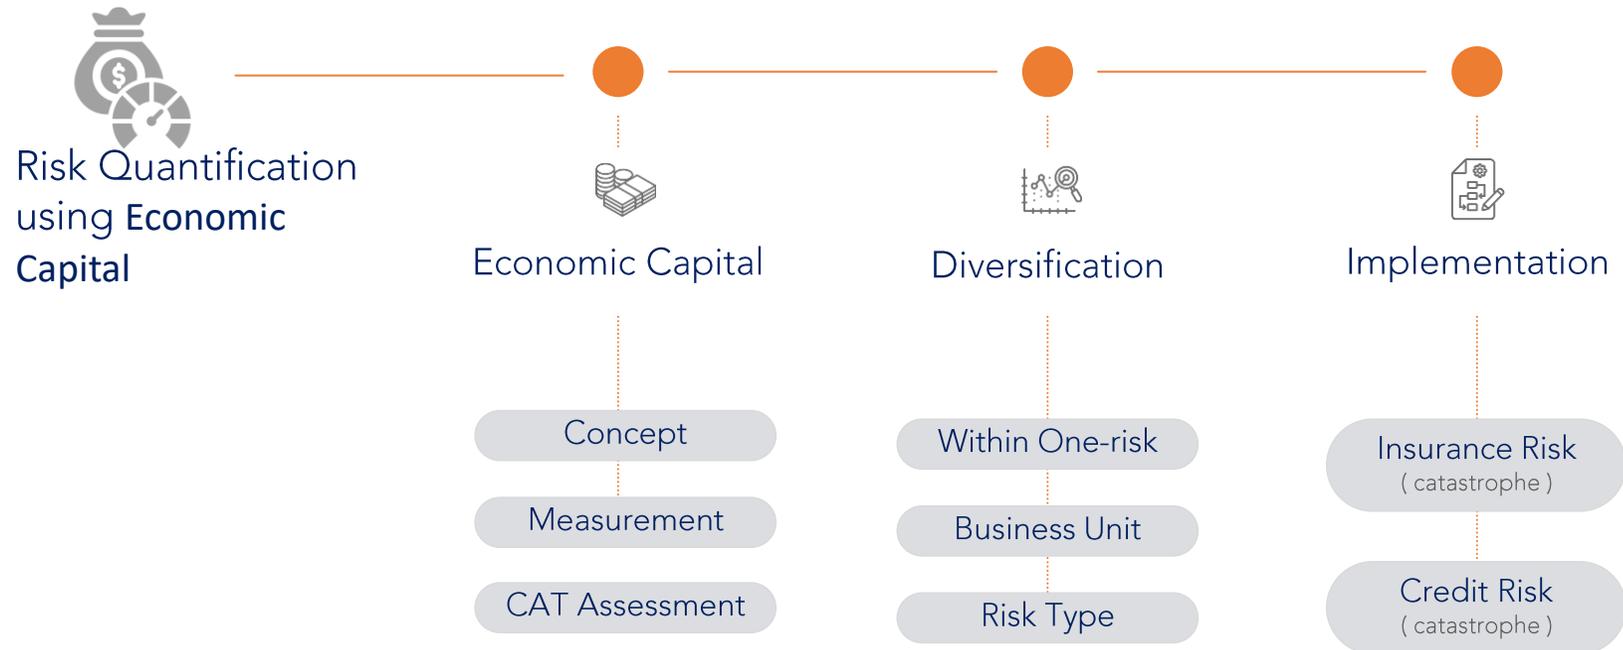

# Economic Capital

---

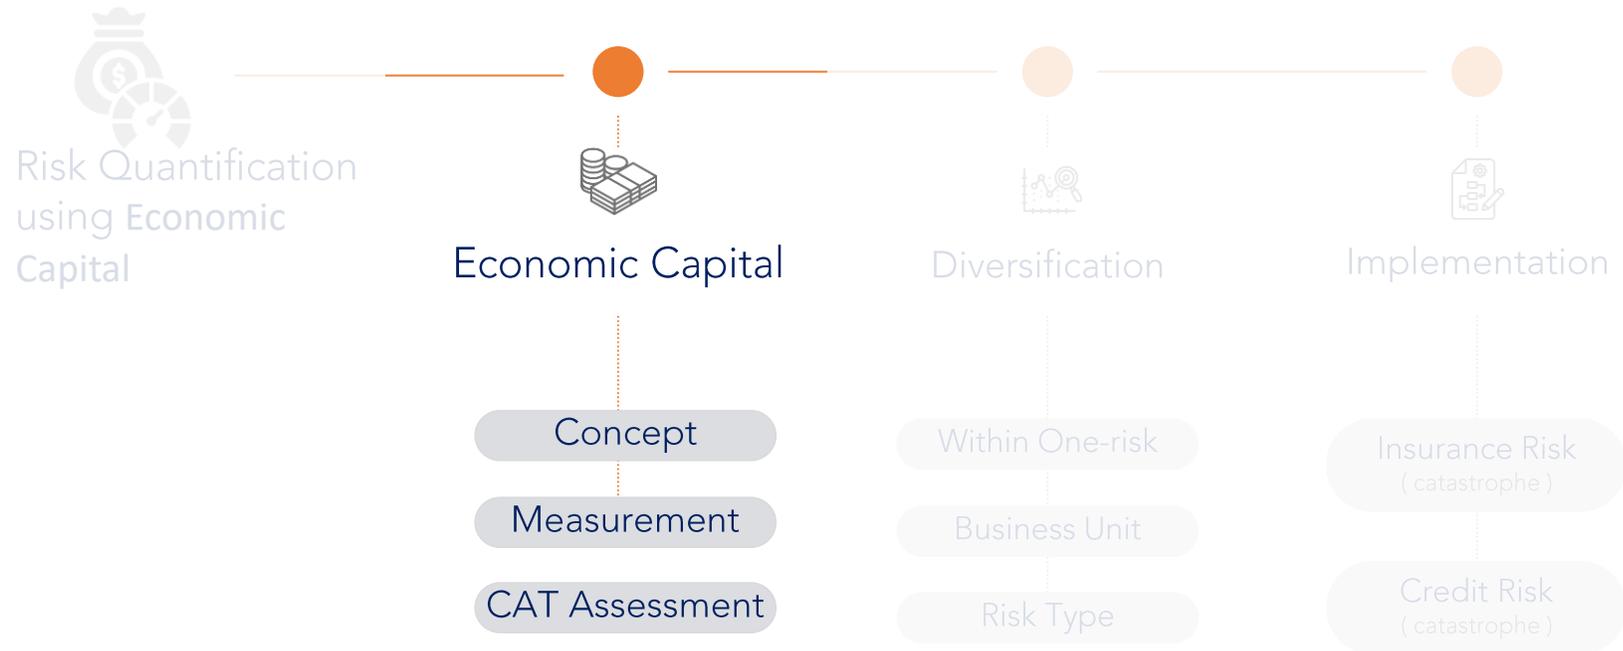

# Economic Capital

Better understanding on risk assessment

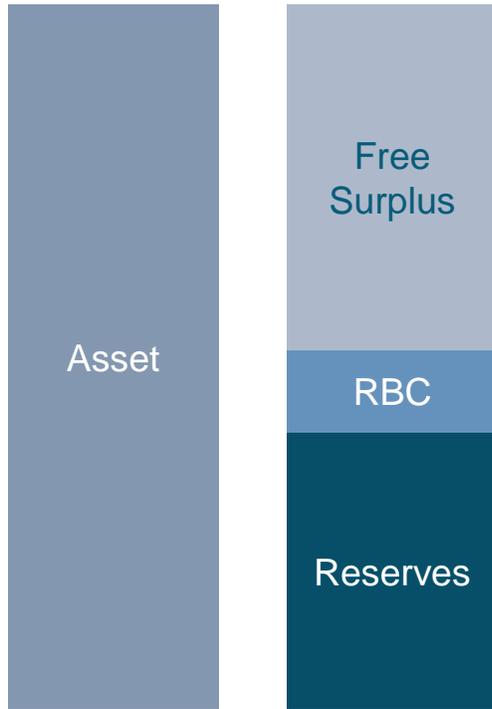

# Economic Capital

Better understanding on risk assessment

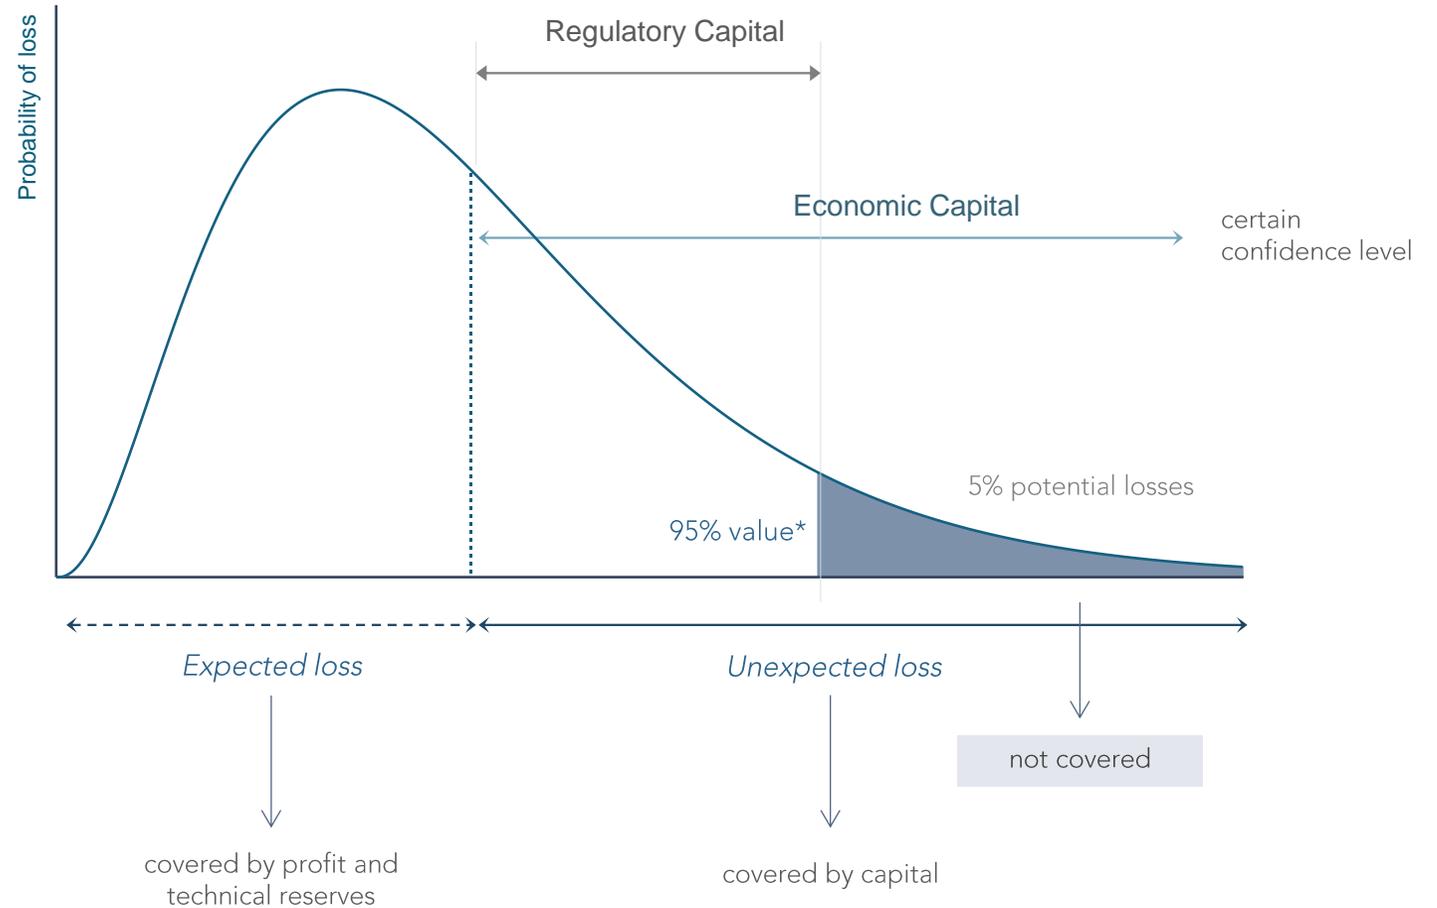

# The Concept of Economic Capital

Not only a minimum capital adequacy, rather about strategic safeguards for business continuity

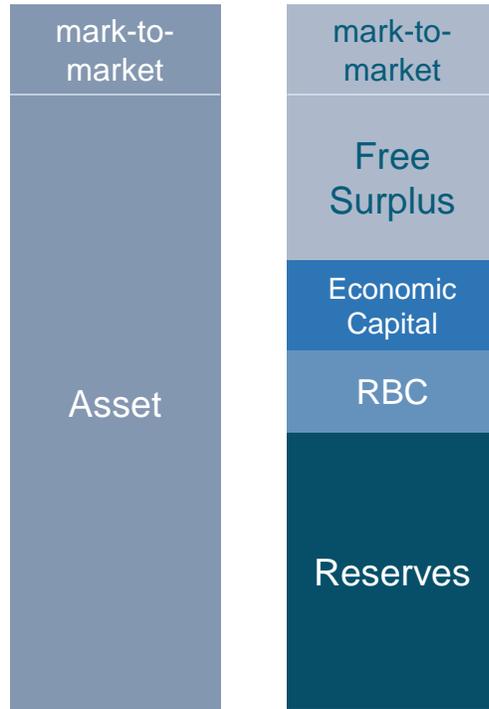

Regulatory risk-based capital (RBC) is based on prescribed formulaic approach and also using 'risk factor' as a constant to determine the capital buffer for the risk.

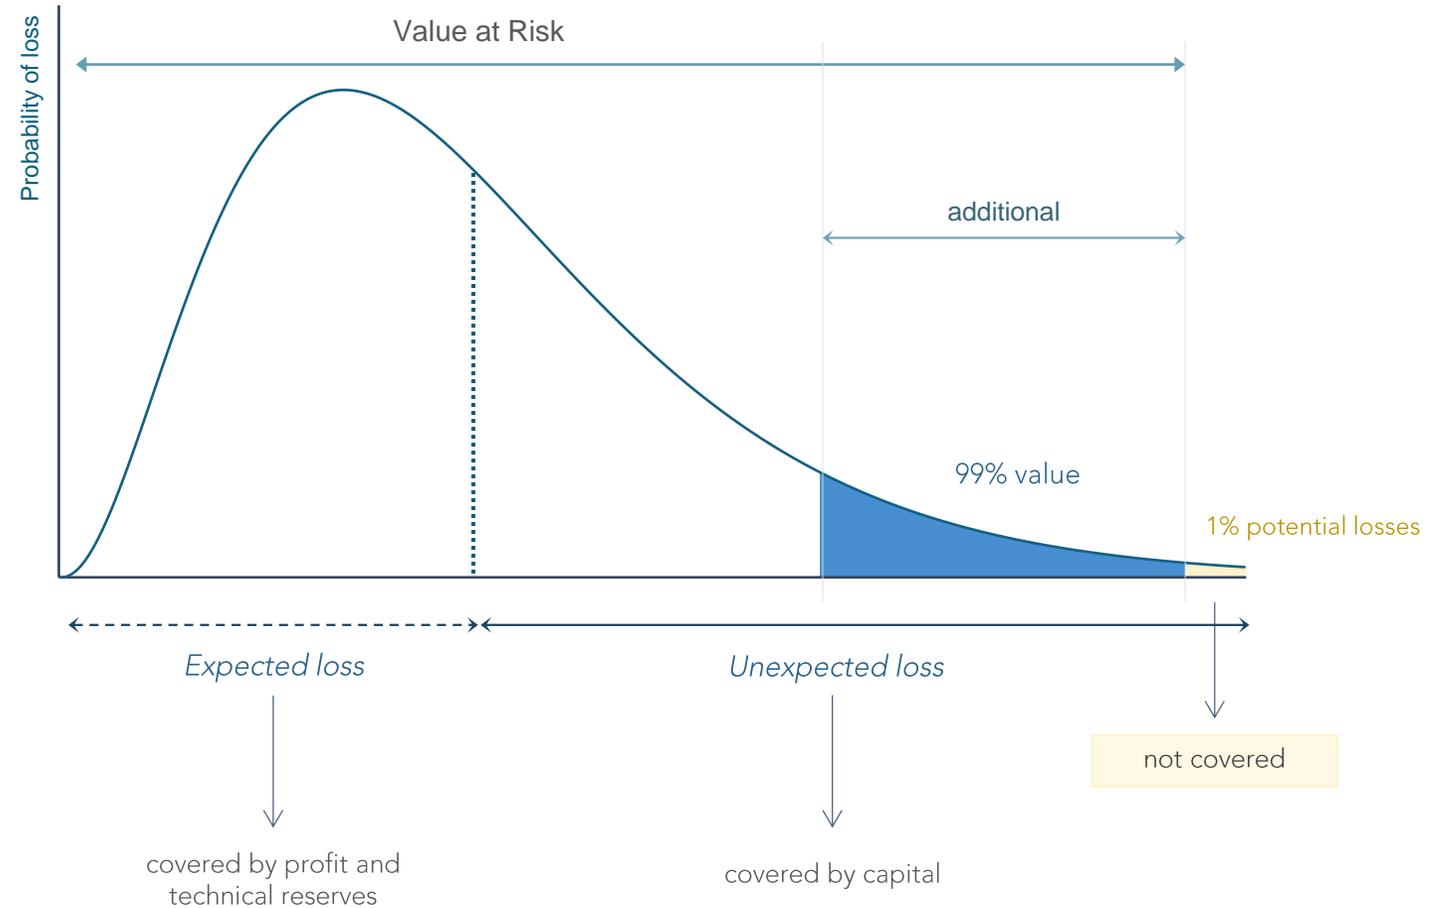

\* Typical regulatory requirement

# The Concept of Economic Capital

Not only a minimum capital adequacy, rather about strategic safeguards for business continuity

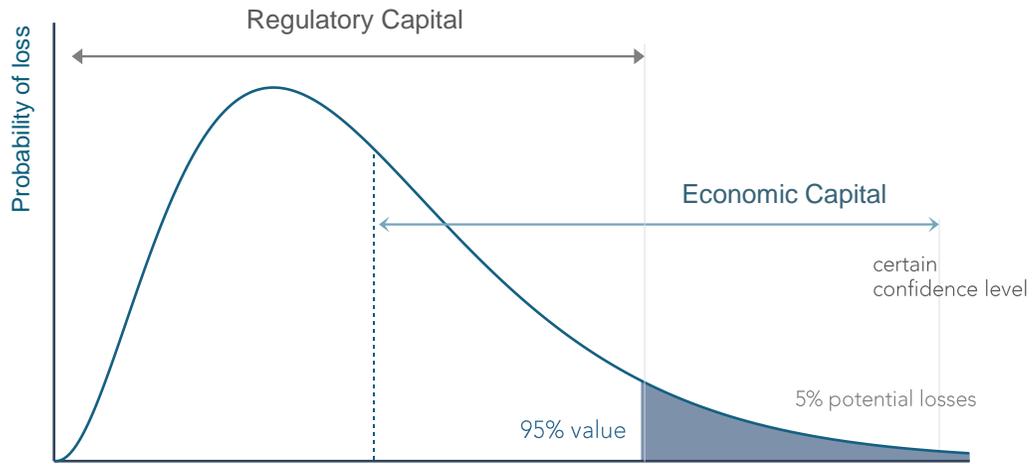

Economic capital is based on an insurer's individual risks. More actuarial work involved in the assessment and calculation

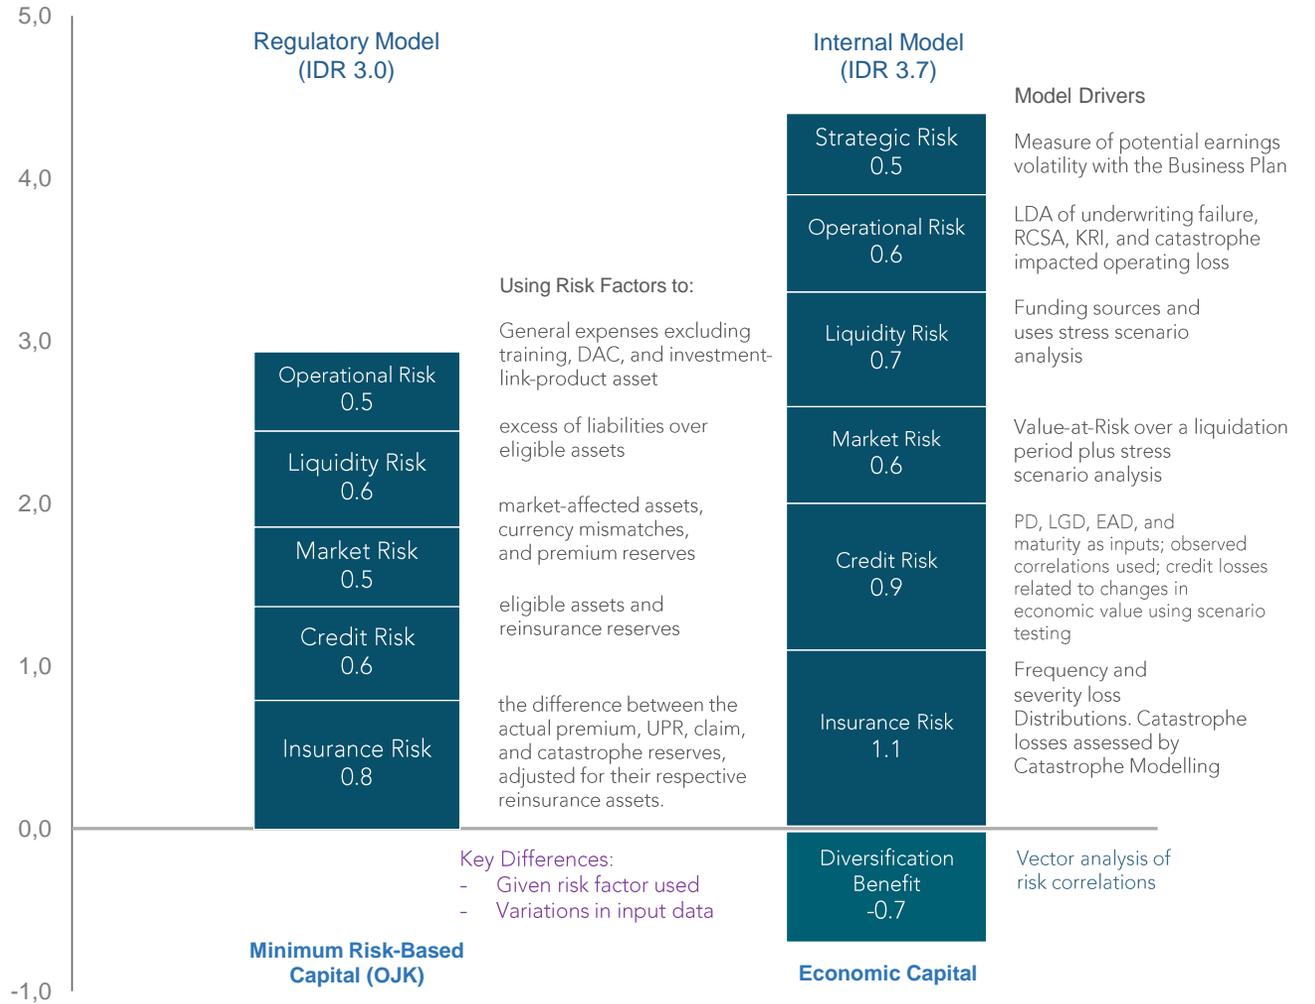

# Economic Capital Measurement

Internal model used to improve risk-based capital allocation

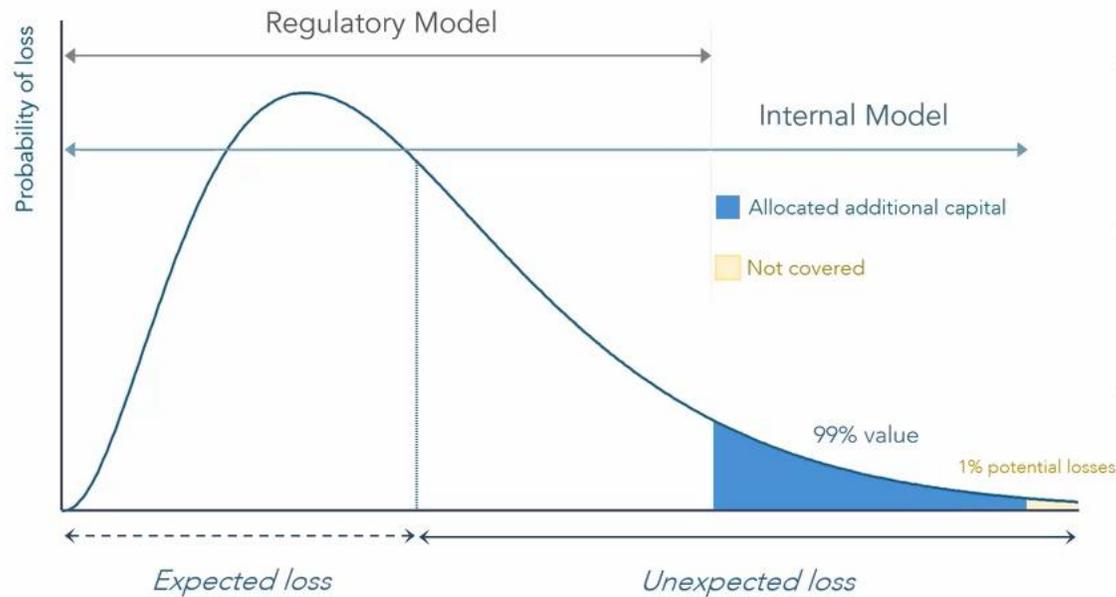

Capital (IDR trillions) **Example Comparison of Minimum Regulatory Risk Based Capital with Economic Capital**

\*illustrative purposes only

# Economic Capital Measurement

Internal model used to improve risk-based capital allocation

- confidence level
- company's risk appetite.
- diversification benefit

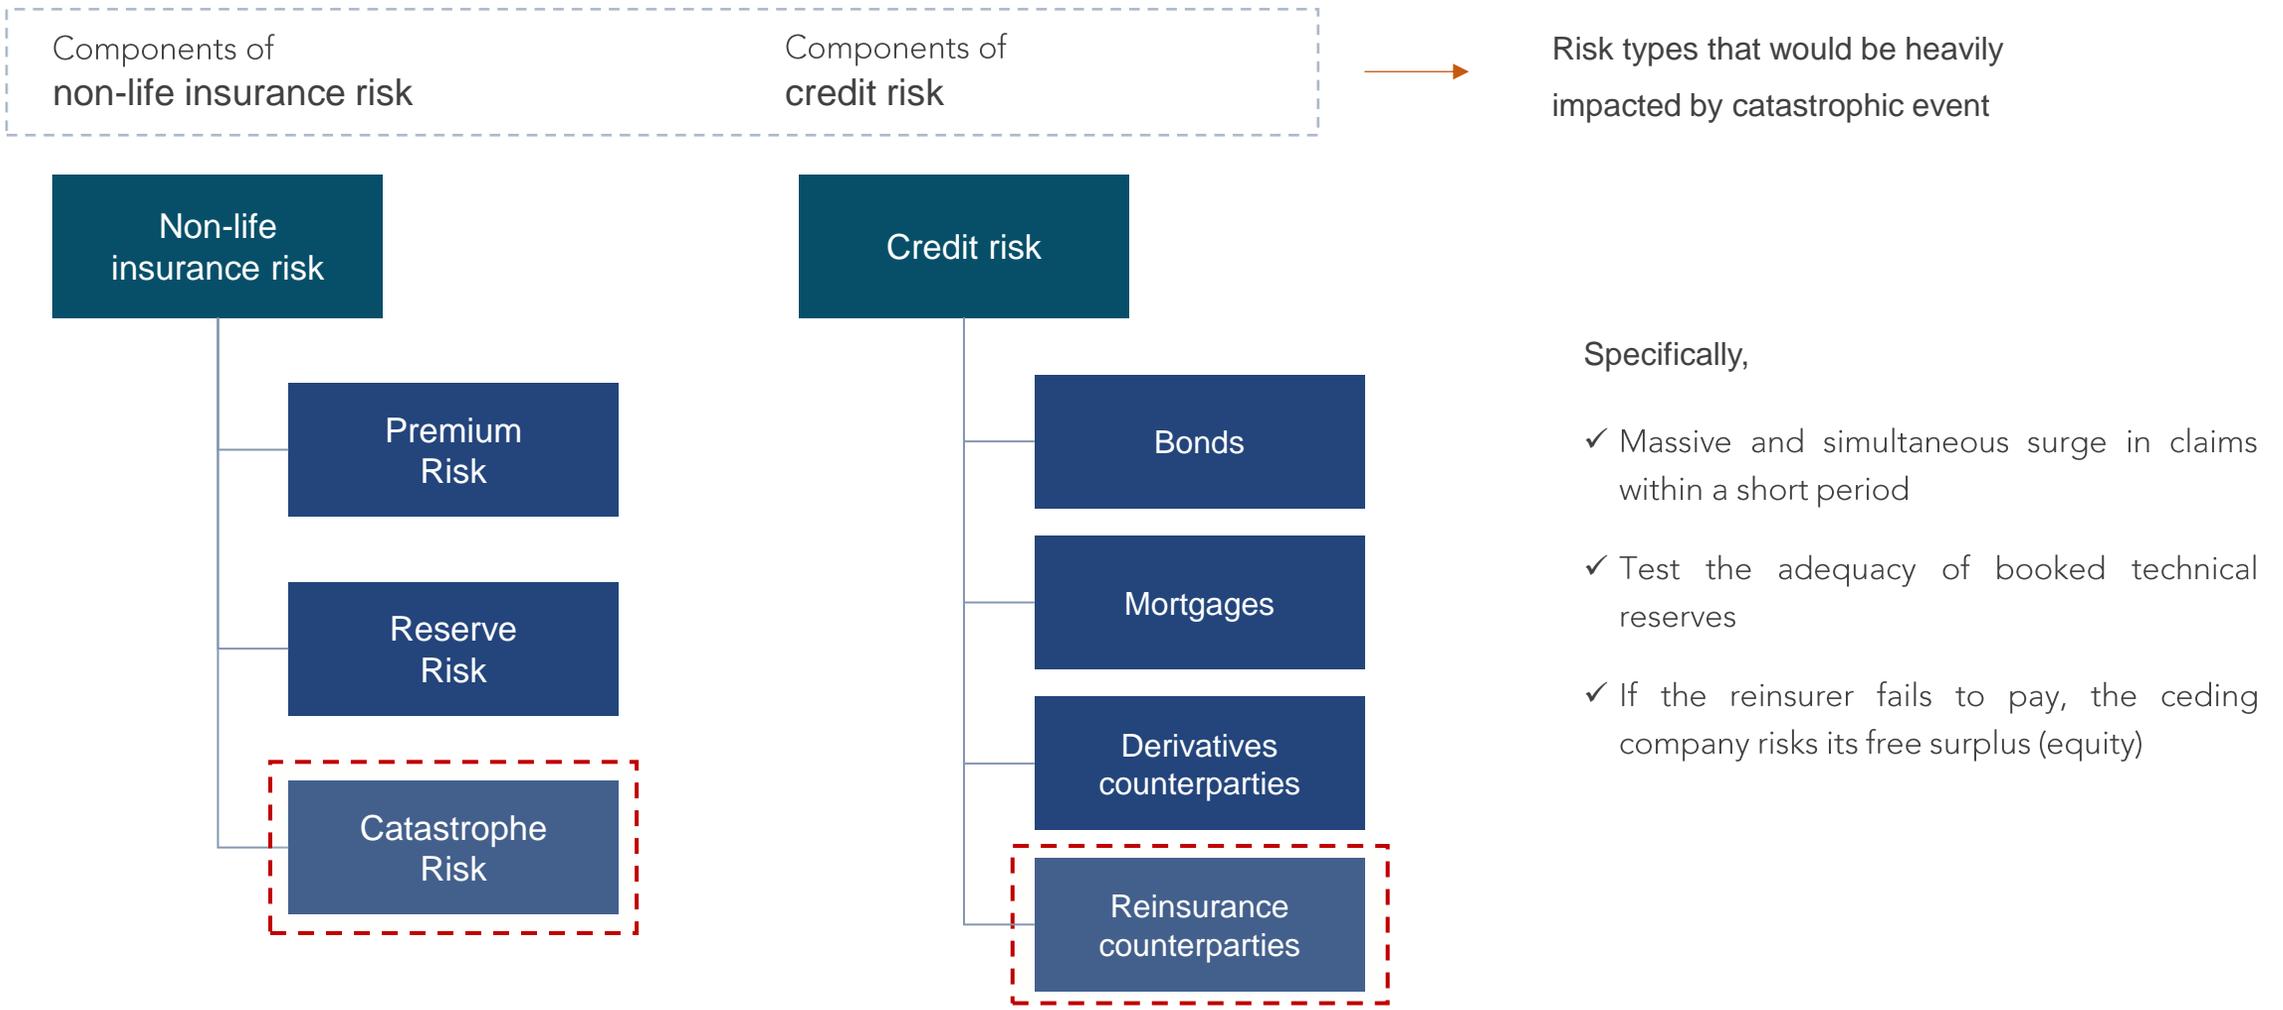

Capital (IDR trillions) **Example Comparison of Minimum Regulatory Risk Based Capital with Economic Capital**

\*illustrative purposes only

# Catastrophe Event – Economic Capital Assessment

Primary risk type affected by catastrophe event

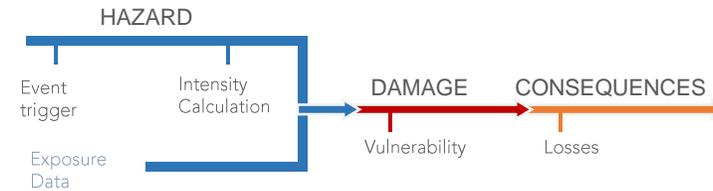

# Catastrophe Event – Economic Capital Assessment

How we assess the impact of catastrophe

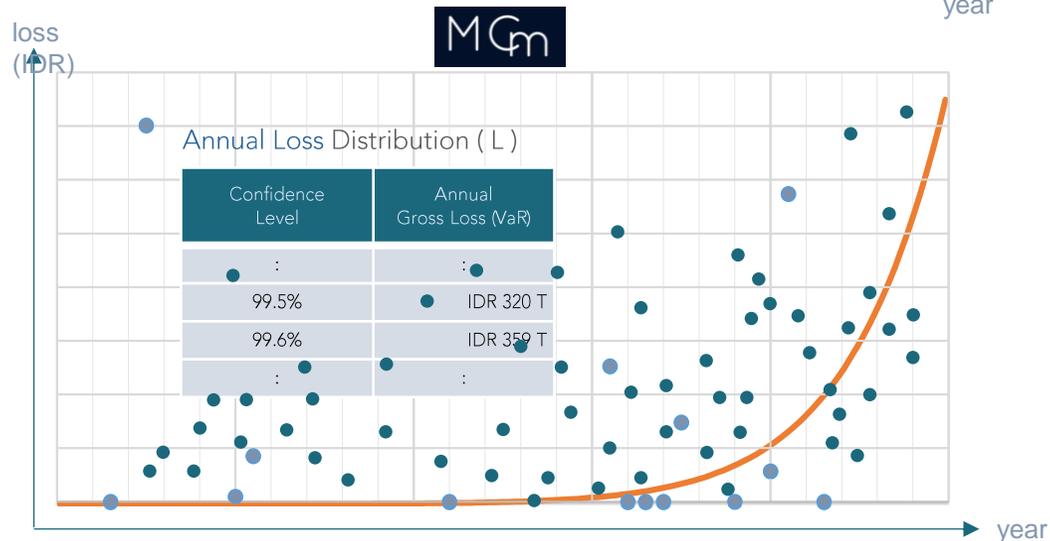

## Insurance Risk

$\alpha$   $Var_{\alpha}$

$$VaR_{\alpha}(L) - E[L]$$

## Credit Risk

$$PD \times LGD \times EAD$$

Exposure at default (EAD) is calculated based on:

- each reinsurance panel
- loss distribution of the reinsured portion
- applicable reinsurance structure
- given confidence level
- company's risk appetite

# Economic Capital

Better understanding on risk assessment

# Diversification Benefit Measurement

Assessed using correlation matrices for each type of diversification

## Gross Economic Capital after Diversification Benefit

Risk	BU 1	BU 2	BU 3	Total EC
Market	EC <sub>11</sub>	EC <sub>12</sub>	EC <sub>13</sub>	EC <sub>1j</sub>
Credit	EC <sub>21</sub>	EC <sub>11</sub>	EC <sub>11</sub>	EC <sub>2j</sub>
Insurance	EC <sub>31</sub>	<b>EC<sub>11</sub></b>	EC <sub>11</sub>	EC <sub>3j</sub>
Strategic	EC <sub>41</sub>	EC <sub>11</sub>	EC <sub>11</sub>	EC <sub>4j</sub>
Operational	EC <sub>51</sub>	EC <sub>11</sub>	EC <sub>11</sub>	EC <sub>5j</sub>
Total EC	EC <sub>i1</sub>	EC <sub>i2</sub>	EC <sub>i3</sub>	Total EC

Diagram annotations: A vertical arrow labeled '3' points down from the BU 1 column. A horizontal arrow labeled '2' points right from the Market row. A red circle labeled '1' is placed over the Insurance row, BU 2 cell.

## Correlation Matrix

RISK TYPE	Market Risk	Credit Risk	Insurance Risk	Strategic Risk	Operational Risk
Market Risk	1	0.29	0.75	0.19	0.01
Credit Risk	0.48	1	0.04	0.99	0.54
Insurance Risk	0.10	0.62	1	0.15	0.02
Strategic Risk	0.10	0.02	0.20	1	0.31
Operational Risk	0.93	0.00	0.83	0.82	1

# Diversification Benefit Measurement

Three types of diversification benefit

## Gross Economic Capital

in millions of IDR

Risk	BU 1	BU 2	BU 3	Total EC
Market	377,043	269,379	113,823	760,245
